AB - PURPOSE: To obtain a laminated film having flexibility, mechanical properties and low temp. heat sealability equivalent to those of a soft vinyl chloride film or vinylon film as a soft polyolefinic film not generating chlorine gas or hydrogen chloride at the time of incineration and especially high in interlaminar strength.  
- CONSTITUTION: A laminated film is constituted of a layer (A) composed of a resin compsn. prepared by compounding 0.5-50 pts.wt. of an ethylenic resin with 100 pts.wt. of a mixture consisting of 20 100wt.% of amorphous polyolefin with propylene and/or butene-1 content of 50wt.% or more and 80-0wt.% of crystalline polypropylene and a layer (B) composed of an ethylenic resin.

The laminated film is formed of: (A) a layer of a resin comps. formed  
by blending: (1) a 100 pts. wt.-mixt. contg. 20-100 wt.-%-amorphous  
polyolefin contg. propylene and/or butene-1, at least 50 wt.-% and 80-0  
wt.-%-crystalline propylene with; (b) a 0.5-50 pts. wt.-ethylene-based  
resin; and (B) a layer consisting of an ethylene-based resin. The  
amorphous polyolefin has a number-average molecular wt. of  
1,000-2,000, pref. 1,200-100,000, more pref. 1,500-20,000.  
- ADVANTAGE - Co-extruding or laminating the layer (A) and the layer (B)  
yields the laminated film having superior transparency, haze, gloss,  
flexibility, mechanical strengths, and low heat sealing as opposed to  
a soft vinyl chloride film or a vinylon film. The laminated film has  
high layer-to-layer adhesive strength. (Dwg. 0/0)
